General

   Messenger is a desktop application designed to move large datasets into a user's cloud storage and/or connected software.   It is most useful for sending bulk data stored on a single computer or a collection of historical files saved on thumb drives or hard drives. It can run in the background, freeing your internet browsers from a heavy workload.   Additionally, one can set default destinations to make sending files even faster.

## Quick Guide to QC Pro Messenger

1. Double-Click the QC Pro Messenger icon
2. Choose to send a file or a folder (folder is the most common)
3. Click Browse Folders
4. Select a file or folder to send and click OK
